Definitions of Managed Objects for Bridges with Traffic Classes, Multicast Filtering, and Virtual LAN Extensions

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP-based internets. In particular, it defines two MIB modules for managing the capabilities of MAC bridges defined by the IEEE 802.1D-1998 (TM) MAC Bridges and the IEEE 802.1Q-2003 (TM) Virtual LAN (VLAN) standards for bridging between Local Area Network (LAN) segments. One MIB module defines objects for managing the 'Traffic Classes' and 'Enhanced Multicast Filtering' components of IEEE 802.1D-1998 and P802.1t-2001 (TM). The other MIB module defines objects for managing VLANs, as specified in IEEE 802.1Q-2003, P802.1u (TM), and P802.1v (TM).

Provisions are made for support of transparent bridging. Provisions are also made so that these objects apply to bridges connected by subnetworks other than LAN segments.

This memo supplements RFC 4188 and obsoletes RFC 2674.

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

2. Overview

A common device present in many networks is the Bridge. This device is used to connect Local Area Network segments below the network layer. These devices are often known as 'layer 2 switches'.

The transparent method of bridging is defined by IEEE 802.1D-1998 [802.1D]. Managed objects for transparent bridging are defined in the BRIDGE-MIB [BRIDGE-MIB].

The original IEEE 802.1D is augmented by IEEE 802.1Q-2003 [802.1Q] to provide support for 'virtual bridged LANs' where a single bridged physical LAN network may be used to support multiple logical bridged LANs, each of which offers a service approximately the same as that defined by IEEE 802.1D. Such virtual LANs (VLANs) are an integral feature of switched LAN networks. A VLAN can be viewed as a group of end-stations on multiple LAN segments and can communicate as if they were on a single LAN. IEEE 802.1Q defines port-based Virtual LANs where membership is determined by the bridge port on which data frames are received, and port-and-protocol-based Virtual LANs where membership is determined by the bridge port on which frames are received and the protocol identifier of the frame. This memo defines the objects needed for the management of port-based VLANs in bridge entities.

This memo supplements RFC 4188 [BRIDGE-MIB] and obsoletes RFC 2674 [RFC2674].

2.1. Scope

The MIB modules defined in this document include a comprehensive set of managed objects that attempts to match the set defined in IEEE 802.1D and IEEE 802.1Q. However, to be consistent with the spirit of

the SNMP Framework, a subjective judgement was made to omit the objects from those standards most 'costly' to implement in an agent and least 'essential' for fault and configuration management. The omissions are described in Section 3 below.

Historical note:

The original BRIDGE-MIB [RFC1493] used the following principles for determining inclusion of an object in the BRIDGE-MIB module:

- (1) Start with a small set of essential objects and add only as further objects are needed.
- (2) Require that objects be essential for either fault or configuration management.
- (3) Consider evidence of current use and/or utility.
- (4) Limit the total number of objects.
- (5) Exclude objects that are simply derivable from others in this or other MIBs.
- (6) Avoid causing critical sections to be heavily instrumented. The guideline that was followed is one counter per critical section per layer.

3. Structure of MIBs

This document defines objects that supplement those in the BRIDGE-MIB module [BRIDGE-MIB]. Section 3.4.3 of the present document contains some recommendations regarding usage of objects in the BRIDGE-MIB by devices implementing the enhancements defined here.

An extended bridge MIB module P-BRIDGE-MIB defines managed objects for the traffic class and multicast filtering enhancements defined by IEEE 802.1D-1998 [802.1D], including the Restricted Group Registration control defined by IEEE P802.1t [802.1t].

A virtual bridge MIB module Q-BRIDGE-MIB defines managed objects for the Virtual LAN bridging enhancements defined by IEEE 802.1Q-2003 [802.1Q], including the Restricted VLAN Registration control, defined by IEEE P802.1u [802.1u], and the VLAN Classification by Protocol and Port enhancement, defined by IEEE P802.1v [802.1v].

3.1. Structure of Extended Bridge MIB Module

Objects in this MIB are arranged into subtrees. Each subtree is organized as a set of related objects. The overall structure and assignment of objects to their subtrees is shown below.

3.1.1. Relationship to IEEE 802.1D-1998 Manageable Objects

This section contains a cross-reference to the objects defined in IEEE 802.1D-1998 [802.1D]. It also details those objects that are not considered necessary in this MIB module.

Some objects defined by IEEE 802.1D-1998 have been included in the virtual bridge MIB module rather than this one: entries in dot1qTpGroupTable, dot1qForwardAllTable, and dot1qForwardUnregisteredTable are required for virtual bridged LANs with additional indexing (e.g., per-VLAN, per-Filtering-Database (per-FDB)) and so are not defined here. Instead, devices that do not implement virtual bridged LANs but do implement the Extended Forwarding Services defined by IEEE 802.1D (i.e., dynamic learning of multicast group addresses and group service requirements in the filtering database) should implement these tables with a fixed value for dot1qFdbId (the value 1 is recommended) or dot1qVlanIndex (the value 1 is recommended). Devices that support Extended Filtering Services should support dot1qTpGroupTable, dot1qForwardAllTable, and dot1qForwardUnregisteredTable.

The following IEEE 802.1D-1998 management objects have not been included in the Bridge MIB for the indicated reasons.

IEEE 802.1D-1998 Object	Disposition
Bridge.StateValue	not considered useful
Bridge.ApplicantAdministrativeControl	not provided per-attribute (e.g., per-VLAN, per-Group). Only per-{device,port,application} control is provided in this MIB.
notify group registration failure (IEEE 802.1t 14.10.1.2)	not considered useful

3.1.2. Relationship to IEEE 802.1Q Manageable Objects

This section contains section number cross-references to manageable objects defined in IEEE 802.1Q-2003 [802.1Q]. These objects have been included in this MIB as they provide a natural fit with the IEEE 802.1D objects with which they are co-located.

Extended Bridge MIB Name	IEEE 802.1Q-2003 Section and Name
dot1dExtBase	Bridge
dot1dDeviceCapabilities	
dot1qStaticEntryIndividualPort	5.2 implementation options
dot1qIVLCapable	
dot1qSVLCapable	
dot1qHybridCapable	
dot1qConfigurablePvidTagging	12.10.1.1 read bridge vlan config

dot1dPortCapabilities	
dot1qDot1qTagging	5.2 implementation options
dot1qConfigurableAcceptableFrameTypes	5.2 implementation options
dot1qIngressFiltering	5.2 implementation options

3.1.3. The dot1dExtBase Subtree

This subtree contains the objects that are applicable to all bridges implementing the traffic class and multicast filtering features of IEEE 802.1D-1998 [802.1D]. It includes per-device configuration of Generic Attribute Registration Protocol (GARP) and GARP Multicast Registration Protocol (GMRP) protocols.

3.1.4. The dot1dPriority Subtree

This subtree contains the objects for configuring and reporting status of priority-based queuing mechanisms in a bridge. This includes per-port `user_priority` treatment, mapping of `user_priority` in frames into internal traffic classes, and outbound `user_priority` and `access_priority`.

3.1.5. The dot1dGarp Subtree

This subtree contains the objects for configuring and reporting on operation of the Generic Attribute Registration Protocol (GARP).

3.1.6. The dot1dGmrp Subtree

This subtree contains the objects for configuring and reporting on operation of the GARP Multicast Registration Protocol (GMRP).

3.1.7. The dot1dTpHCPortTable

This table extends the dot1dTp subtree from the BRIDGE-MIB [BRIDGE-MIB] and contains the objects for reporting port-bridging statistics for high-capacity network interfaces.

3.1.8. The dot1dTpPortOverflowTable

This table extends the dot1dTp subtree from the BRIDGE-MIB [BRIDGE-MIB] and contains the objects for reporting the upper bits of port-bridging statistics for high-capacity network interfaces for when 32-bit counters are inadequate.

3.2. Structure of Virtual Bridge MIB module

Objects in this MIB are arranged into subtrees. Each subtree is organized as a set of related objects. The overall structure and assignment of objects to their subtrees is shown below. Some manageable objects defined in the BRIDGE-MIB [BRIDGE-MIB] need to be indexed differently when they are used in a VLAN bridging environment: these objects are, therefore, effectively duplicated by new objects with different indexing, which are defined in the Virtual Bridge MIB.

3.2.1. Relationship to IEEE 802.1Q Manageable Objects

This section contains section-number cross-references to manageable objects defined in clause 12 of IEEE 802.1Q-2003 [802.1Q]. It also details those objects that are not considered necessary in this MIB module.

Note: Unlike IEEE 802.1D-1998, IEEE 802.1Q-2003 [802.1Q] did not define exact syntax for a set of managed objects. The following cross-references indicate the section numbering of the descriptions of management operations from clause 12 in the latter document.

The following IEEE 802.1Q management objects have not been included in the Bridge MIB for the indicated reasons.

IEEE 802.1Q-2003 Operation	Disposition
reset bridge (12.4.1.4)	not considered useful
reset vlan bridge (12.10.1.5)	not considered useful
read forwarding port counters (12.6.1.1)	
discard on error details	not considered useful
read permanent database (12.7.6.1)	
permanent database size	not considered useful
number of static filtering entries	count rows in dot1qStaticUnicastTable + dot1qStaticMulticastTable
number of static VLAN registration entries	count rows in dot1qVlanStaticTable
read filtering entry range (12.7.7.4)	use GetNext operation.
read filtering database (12.7.1.1)	
filtering database size	not considered useful
number of dynamic group address entries (12.7.1.3)	count rows applicable to each FDB in dot1dTpGroupTable
read garp state (12.9.3.1)	not considered useful
notify vlan registration failure (12.10.1.6)	not considered useful

notify learning constraint violation
(12.10.3.10) not considered useful

3.2.2. The dot1qBase Subtree

This subtree contains the objects that are applicable to all bridges implementing IEEE 802.1Q virtual LANs.

3.2.3. The dot1qTp Subtree

This subtree contains objects that control the operation and report the status of transparent bridging. This includes management of the dynamic Filtering Databases for both unicast and multicast forwarding. This subtree will be implemented by all bridges that perform destination-address filtering.

3.2.4. The dot1qStatic Subtree

This subtree contains objects that control static configuration information for transparent bridging. This includes management of the static entries in the Filtering Databases for both unicast and multicast forwarding.

3.2.5. The dot1qVlan Subtree

This subtree contains objects that control configuration and report status of the Virtual LANs known to a bridge. This includes management of the statically configured VLANs as well as reporting VLANs discovered by other means (e.g., GARP VLAN Registration Protocol (GVRP)). It also controls configuration and reports status of per-port objects relating to VLANs and reports traffic statistics. It also provides for management of the VLAN Learning Constraints.

3.3. Textual Conventions

Various Working Groups have defined standards-track MIB documents (for example, [RFC2613] and [RFC3318]), that contain objects and Textual Conventions to represent a Virtual Local Area Network Identifier (VLAN-ID) [802.1Q]. New definitions are showing up in various documents (for example, [RFC4323] and [RFC4149]). Unfortunately, the result is a set of different definitions for the same piece of management information. This may lead to confusion and unnecessary complexity. In order to address this situation, three new textual conventions are defined in the Q-BRIDGE-MIB, called VlanIdOrAny, VlanIdOrNone, and VlanIdOrAnyOrNone. These new textual conventions should be (re)used in MIB modules so that they all represent a VLAN-ID in the same way.

These textual conventions provide a means to specify MIB objects that refer to a specific VLAN, to any VLAN, or to no VLAN. For an example of how these textual conventions might be used, consider a MIB object, with SYNTAX of `VlanIdOrAnyOrNone`, that specifies the VLAN on which to accept incoming packets of a particular protocol. Such an object would allow the device to be configured to accept packets of this protocol received with a specific 802.1q tag value, with any 802.1q tag value, or with no 802.1q tag. Note that a MIB object that is defined using one of these textual conventions should clarify the meaning of 'any VLAN' and/or 'no VLAN' in its DESCRIPTION clause.

3.4. Relationship to Other MIBs

As described above, some IEEE 802.1D management objects have not been included in this MIB because they overlap with objects in other MIBs applicable to a bridge implementing this MIB module.

3.4.1. Relationship to the SNMPv2-MIB

The SNMPv2-MIB [RFC3418] defines objects that are generally applicable to managed devices. These objects apply to the device as a whole, irrespective of whether bridging is the device's sole functionality or only a subset of the device's functionality.

Full support for the 802.1D management objects requires that the SNMPv2-MIB objects `sysDescr` and `sysUpTime` be implemented. Note that compliance to the current SNMPv2-MIB module requires additional objects and notifications to be implemented as specified in RFC 3418 [RFC3418].

3.4.2. Relationship to the IF-MIB

The IF-MIB, [RFC2863], requires that any MIB that is an adjunct of the IF-MIB clarify specific areas within the IF-MIB. These areas were intentionally left vague in the IF-MIB in order to avoid over-constraining the MIB, thereby precluding management of certain media-types.

The IF-MIB enumerates several areas that a media-specific MIB must clarify. Each of these areas is addressed in a following subsection. The implementor is referred to the IF-MIB in order to understand the general intent of these areas.

The IF-MIB [RFC2863] defines managed objects for managing network interfaces. A network interface is considered attached to a 'subnetwork'. (Note that this term is not to be confused with 'subnet', which refers to an addressing partitioning scheme used in the Internet suite of protocols.) The term 'segment' is used in this

memo to refer to such a subnetwork, whether it be an Ethernet segment, a 'ring', a WAN link, or even an X.25 virtual circuit.

Full support for the 802.1D management objects requires that the IF-MIB objects `ifIndex`, `ifType`, `ifDescr`, `ifPhysAddress`, and `ifLastChange` are implemented. Note that compliance to the current IF-MIB module requires additional objects and notifications to be implemented as specified in RFC 2863 [RFC2863].

Implicit in this Extended Bridge MIB is the notion of ports on a bridge. Each of these ports is associated with one interface of the 'interfaces' subtree (one row in `ifTable`), and, in most situations, each port is associated with a different interface. However, there are situations in which multiple ports are associated with the same interface. An example of such a situation would be several ports each corresponding one-to-one with several X.25 virtual circuits but all on the same interface.

Each port is uniquely identified by a port number. A port number has no mandatory relationship to an interface number, but in the simple case a port number will have the same value as the corresponding interface's interface number. Port numbers are in the range (1..`dot1dBaseNumPorts`).

Some entities perform other functionality as well as bridging through the sending and receiving of data on their interfaces. In such situations, only a subset of the data sent/received on an interface is within the domain of the entity's bridging functionality. This subset is considered delineated according to a set of protocols, with some protocols being bridged, and other protocols not being bridged. For example, in an entity that exclusively performed bridging, all protocols would be considered bridged, whereas in an entity that performed IP routing on IP datagrams and only bridged other protocols, only the non-IP data would be considered bridged.

Thus, this Extended Bridge MIB (and in particular, its counters) is applicable only to that subset of the data on an entity's interfaces that is sent/received for a protocol being bridged. All such data is sent/received via the ports of the bridge.

3.4.2.1. Layering Model

This memo assumes the interpretation of the Interfaces Subtree to be in accordance with the IF-MIB [RFC2863], which states that the interfaces table (`ifTable`) contains information on the managed resource's interfaces and that each sub-layer below the internetwork layer of a network interface is considered an interface.

This document does not make any assumption that within an entity, VLANs that are instantiated as an entry in `dot1qVlanCurrentTable` by either management configuration through `dot1qVlanStaticTable` or by dynamic means (e.g., through GVRP) are also represented by an entry in `ifTable`.

Where an entity contains higher-layer protocol entities (e.g., IP-layer interfaces that transmit and receive traffic to/from a VLAN), these should be represented in the `ifTable` as interfaces of type `propVirtual(53)`. Protocol-specific types such as `l3ipxvlan(137)` should not be used here, since there is no implication that the bridge will perform any protocol filtering before delivering up to these virtual interfaces.

3.4.2.2. `ifStackTable`

In addition, the IF-MIB [RFC2863] defines a table '`ifStackTable`' for describing the relationship between logical interfaces within an entity. It is anticipated that implementors will use this table to describe the binding of (for example) IP interfaces to physical ports, although the presence of VLANs makes the representation less than perfect for showing connectivity. The `ifStackTable` cannot represent the full capability of the IEEE 802.1Q VLAN bridging standard, since that makes a distinction between VLAN bindings on 'ingress' to and 'egress' from a port: these relationships may or may not be symmetrical whereas Interface MIB Evolution assumes a symmetrical binding for transmit and receive. This makes it necessary to define other manageable objects for configuring which ports are members of which VLANs.

3.4.2.3. `ifRcvAddressTable`

This table contains all MAC addresses, unicast, multicast, and broadcast, for which an interface will receive packets and forward them up to a higher-layer entity for local consumption. Note that this does not include addresses for data-link layer control protocols such as Spanning-Tree, GMRP, or GVRP. The format of the address, contained in `ifRcvAddressAddress`, is the same as for `ifPhysAddress`.

This table does not include unicast or multicast addresses that are accepted for possible forwarding out some other port. This table is explicitly not intended to provide a bridge address filtering mechanism.

3.4.3. Relationship to the BRIDGE-MIB

This section defines how objects in the BRIDGE-MIB module [BRIDGE-MIB] should be represented for devices that implement the extensions: some of the old objects are less useful in such devices but must still be implemented for reasons of backwards compatibility.

3.4.3.1. The dotldBase Subtree

This subtree contains objects that are applicable to all types of bridges. Interpretation of this subtree is unchanged.

3.4.3.2. The dotldStp Subtree

This subtree contains the objects that denote the bridge's state with respect to the Spanning Tree Protocol. Interpretation of this subtree is unchanged.

3.4.3.3. The dotldTp Subtree

This subtree contains objects that describe the entity's state with respect to transparent bridging.

In a device operating with a single Filtering Database, interpretation of this subtree is unchanged.

In a device supporting multiple Filtering Databases, this subtree is interpreted as follows:

dotldTpLearnedEntryDiscards

The number of times that *any* of the FDBs became full.

dotldTpAgingTime

This applies to all Filtering Databases.

dotldTpFdbTable

Report MAC addresses learned on each port, regardless of which Filtering Database they have been learned in. If an address has been learned in multiple databases on a single port, report it only once. If an address has been learned in multiple databases on more than one port, report the entry on any one of the valid ports.

dot1dTpPortTable

This table is port-based and is not affected by multiple Filtering Databases or multiple VLANs. The counters should include frames received or transmitted for all VLANs. Note that equivalent 64-bit port statistics counters, as well as other objects to represent the upper 32 bits of these counters, are defined in this document for high-capacity network interfaces. These have conformance statements to indicate for which speeds of interface they are required.

3.4.3.4. The dot1dStatic Subtree

This optional subtree contains objects that describe the configuration of destination-address filtering.

In a device operating with a single Filtering Database, interpretation of this subtree is unchanged.

In a device supporting multiple Filtering Databases, this subtree is interpreted as follows:

dot1dStaticTable

Entries read from this table include all static entries from all of the Filtering Databases. Entries for the same MAC address and receive port in more than one Filtering Database must appear only once, since these are the indices of this table. This table should be implemented as read-only in devices that support multiple Forwarding Databases. Instead, write access should be provided through dot1qStaticUnicastTable and dot1qStaticMulticastTable, as defined in this document.

3.4.3.5. Additions to the BRIDGE-MIB

To supplement the BRIDGE-MIB [BRIDGE-MIB], this module contains:

- (1) support for multiple traffic classes and dynamic multicast filtering as per IEEE 802.1D-1998 [802.1D].
- (2) support for bridged Virtual LANs as per IEEE 802.1Q-2003 [802.1Q].
- (3) support for 64-bit versions of BRIDGE-MIB [BRIDGE-MIB] port counters.

DESCRIPTION

"The Bridge MIB Extension module for managing Priority and Multicast Filtering, defined by IEEE 802.1D-1998, including Restricted Group Registration defined by IEEE 802.1t-2001.

Copyright (C) The Internet Society (2006). This version of this MIB module is part of RFC 4363; See the RFC itself for full legal notices."

REVISION "200601090000Z"

DESCRIPTION

"Added dot1dPortRestrictedGroupRegistration.
Deprecated pBridgePortGmrpGroup and pBridgeCompliance
and added pBridgePortGmrpGroup2 and pBridgeCompliance2."

REVISION "199908250000Z"

DESCRIPTION

"The Bridge MIB Extension module for managing Priority
and Multicast Filtering, defined by IEEE 802.1D-1998.

Initial version, published as RFC 2674."

DESCRIPTION

"Indicates the optional parts of IEEE 802.1D and 802.1Q that are implemented by this device and are manageable through this MIB. Capabilities that are allowed on a per-port basis are indicated in dot1dPortCapabilities.

```
dot1dExtendedFilteringServices(0),
    -- can perform filtering of
    -- individual multicast addresses
    -- controlled by GMRP.
dot1dTrafficClasses(1),
    -- can map user priority to
    -- multiple traffic classes.
dot1qStaticEntryIndividualPort(2),
    -- dot1qStaticUnicastReceivePort &
    -- dot1qStaticMulticastReceivePort
    -- can represent non-zero entries.
dot1qIVLCapable(3),    -- Independent VLAN Learning (IVL).
dot1qSVLCapable(4),    -- Shared VLAN Learning (SVL).
dot1qHybridCapable(5),
    -- both IVL & SVL simultaneously.
dot1qConfigurablePvidTagging(6),
    -- whether the implementation
    -- supports the ability to
    -- override the default PVID
    -- setting and its egress status
    -- (VLAN-Tagged or Untagged) on
    -- each port.
dot1dLocalVlanCapable(7)
    -- can support multiple local
    -- bridges, outside of the scope
    -- of 802.1Q defined VLANs."

```

```
DESCRIPTION
```

"A table that contains the most-significant bits of statistics counters for ports that are associated with this transparent bridge that are on high-capacity interfaces, as defined in the conformance clauses for this table. This table is provided as a way to read 64-bit counters for agents that support only SNMPv1.

Note that the reporting of most-significant and least-significant counter bits separately runs the risk of missing an overflow of the lower bits in the interval between sampling. The manager must be aware of this possibility, even within the same varbindlist, when interpreting the results of a request or asynchronous notification."

DESCRIPTION

"The VLAN Bridge MIB module for managing Virtual Bridged Local Area Networks, as defined by IEEE 802.1Q-2003, including Restricted Vlan Registration defined by IEEE 802.1u-2001 and Vlan Classification defined by IEEE 802.1v-2001.

Copyright (C) The Internet Society (2006). This version of this MIB module is part of RFC 4363; See the RFC itself for full legal notices."

REVISION "200601090000Z"

DESCRIPTION

"Added Vlan TEXTUAL-CONVENTIONS, dot1qPortRestrictedVlanRegistration, dot1vProtocol subtree, qBridgeClassificationDeviceGroup, qBridgePortGroup2, qBridgeClassificationPortGroup, and qBridgeCompliance2. Clarified dot1qForwardAllStaticPorts, qPortAcceptableFrameTypes, and qBridgeCompliance. Deprecated qBridgePortGroup and qBridgeCompliance."

REVISION "199908250000Z"

DESCRIPTION

"The VLAN Bridge MIB module for managing Virtual Bridged Local Area Networks, as defined by IEEE 802.1Q-1998.

Initial version, published as RFC 2674."

::= { dot1dBridge 7 }

qBridgeMIBObjects OBJECT IDENTIFIER ::= { qBridgeMIB 1 }

-- -----
 -- Textual Conventions
 -- -----

PortList ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"Each octet within this value specifies a set of eight ports, with the first octet specifying ports 1 through 8, the second octet specifying ports 9 through 16, etc. Within each octet, the most significant bit represents the lowest numbered port, and the least significant bit represents the highest numbered port. Thus, each port of the bridge is represented by a single bit within the value of this object. If that bit has a value of '1', then that port is included in the set of ports; the port is not included if its bit has a value of '0'."

SYNTAX OCTET STRING

VlanIndex ::= TEXTUAL-CONVENTION

DISPLAY-HINT "d"

STATUS current

DESCRIPTION

"A value used to index per-VLAN tables: values of 0 and 4095 are not permitted. If the value is between 1 and 4094 inclusive, it represents an IEEE 802.1Q VLAN-ID with global scope within a given bridged domain (see VlanId textual convention). If the value is greater than 4095,

then it represents a VLAN with scope local to the particular agent, i.e., one without a global VLAN-ID assigned to it. Such VLANs are outside the scope of IEEE 802.1Q, but it is convenient to be able to manage them in the same way using this MIB."

SYNTAX Unsigned32

VlanId ::= TEXTUAL-CONVENTION

DISPLAY-HINT "d"

STATUS current

DESCRIPTION

"The VLAN-ID that uniquely identifies a VLAN. This is the 12-bit VLAN-ID used in the VLAN Tag header. The range is defined by the REFERENCED specification."

REFERENCE

"IEEE Std 802.1Q 2003 Edition, Virtual Bridged Local Area Networks."

SYNTAX Integer32 (1..4094)

VlanIdOrAny ::= TEXTUAL-CONVENTION

DISPLAY-HINT "d"

STATUS current

DESCRIPTION

"The VLAN-ID that uniquely identifies a specific VLAN, or any VLAN. The special value of 4095 is used to indicate a wildcard, i.e., any VLAN. This can be used in any situation where an object or table entry must refer either to a specific VLAN or to any VLAN."

Note that a MIB object that is defined using this TEXTUAL-CONVENTION should clarify the meaning of 'any VLAN' (i.e., the special value 4095)."

SYNTAX Integer32 (1..4094 | 4095)

VlanIdOrNone ::= TEXTUAL-CONVENTION

DISPLAY-HINT "d"

STATUS current

DESCRIPTION

"The VLAN-ID that uniquely identifies a specific VLAN, or no VLAN. The special value of zero is used to indicate that no VLAN-ID is present or used. This can be used in any situation where an object or a table entry must refer either to a specific VLAN, or to no VLAN."

Note that a MIB object that is defined using this TEXTUAL-CONVENTION should clarify the meaning of 'no VLAN' (i.e., the special value 0)."

SYNTAX Integer32 (0 | 1..4094)

VlanIdOrAnyOrNone ::= TEXTUAL-CONVENTION

DISPLAY-HINT "d"

STATUS current

DESCRIPTION

"The VLAN-ID that uniquely identifies a specific VLAN, any VLAN, or no VLAN. The special values 0 and 4095 have the same meaning as described in the VlanIdOrAny and VlanIdOrNone TEXTUAL-CONVENTIONS.

Note that a MIB object that is defined using this TEXTUAL-CONVENTION should clarify the meaning of 'any VLAN' and 'no VLAN' (i.e., the special values 0 and 4095)."

dot1qTpFdbStatus OBJECT-TYPE

SYNTAX INTEGER {
 other(1),
 invalid(2),
 learned(3),
 self(4),
 mgmt(5)
 }
MAX-ACCESS read-only
STATUS current
DESCRIPTION

"The status of this entry. The meanings of the values are:

other(1) - none of the following. This may include the case where some other MIB object (not the corresponding instance of dot1qTpFdbPort, nor an entry in the dot1qStaticUnicastTable) is being used to determine if and how frames addressed to the value of the corresponding instance of dot1qTpFdbAddress are being forwarded.

invalid(2) - this entry is no longer valid (e.g., it

was learned but has since aged out), but has not yet been flushed from the table.

learned(3) - the value of the corresponding instance of dot1qTpFdbPort was learned and is being used.

self(4) - the value of the corresponding instance of dot1qTpFdbAddress represents one of the device's addresses. The corresponding instance of dot1qTpFdbPort indicates which of the device's ports has this address.

mgmt(5) - the value of the corresponding instance of dot1qTpFdbAddress is also the value of an existing instance of dot1qStaticAddress."

dot1qNextFreeLocalVlanIndex OBJECT-TYPE

SYNTAX Integer32 (0|4096..2147483647)

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The next available value for dot1qVlanIndex of a local VLAN entry in dot1qVlanStaticTable. This will report values >=4096 if a new Local VLAN may be created or else the value 0 if this is not possible."

A row creation operation in this table for an entry with a local VlanIndex value may fail if the current value of this object is not used as the index. Even if the value read is used, there is no guarantee that it will still be the valid index when the create operation is attempted; another manager may have already got in during the intervening time interval. In this case, dot1qNextFreeLocalVlanIndex should be re-read

and the creation re-tried with the new value.

This value will automatically change when the current value is used to create a new row."

6. Acknowledgements

Much of the groundwork for this document was performed by the IEEE 802.1 working group during the definition of the IEEE 802.1D updates [802.1D] and IEEE 802.1Q [802.1Q].

The authors wish to thank the members of the Bridge Working Group, and David Harrington, Anders SW Christensen, Andrew Smith, Paul Langille, Anil Rijhsinghani, and Keith McCloghrie in particular for their comments and suggestions, which improved this effort.

Editing for the final version was done by David Levi.

The new textual conventions related to VLAN-IDs were produced as a result of a review of the use of VLAN-ID in several MIB modules. Further investigation found that VLAN-ID objects were defined in a few other MIB modules. The editor would like to thank all who contributed to the discussion that resulted in these new textual conventions. Specifically, Bert Wijnen, Les Bell, Andrew Smith, Mike Heard, Randy Presuhn, Dan Romascanu, Eduardo Cardona, Tom Petch, Juergen Schoenwaelder, Richard Woundy, Tony Jeffree, and William Murwin. We also received input and feedback from IEEE confirming that the values 0 and 4095 are not used for identifying a specific VLAN-ID and so can be used to represent none or a wildcard (see Appendix A).

7. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These tables and objects and their sensitivity/vulnerability are described below.

The following tables and objects in the P-BRIDGE-MIB can be manipulated to interfere with the operation of priority classes. This could, for example, be used to force a reinitialization of state machines, thus causing network instability. Another possibility would be for an attacker to override established policy on port priorities, thus giving a user (or an attacker) unauthorized preferential treatment.

- dot1dTrafficClassesEnabled
- dot1dGmrpStatus
- dot1dPortPriorityTable
- dot1dUserPriorityRegenTable

```
dot1dTrafficClassTable
dot1dPortGarpTable
dot1dPortGmrpTable
```

The following tables and objects in the Q-BRIDGE-MIB could be manipulated to interfere with the operation of virtual LANs. This could, for example, be used to force a reinitialization of state machines to cause network instability, or changing the forwarding and filtering policies.

```
dot1qGvrpStatus
dot1qForwardAllTable
dot1qStaticUnicastTable
dot1qStaticMulticastTable
dot1qVlanStaticTable
dot1qPortVlanTable
dot1qLearningConstraintsTable
dot1vProtocolGroupTable
dot1vProtocolPortTable
```

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability.

The objects dot1dDeviceCapabilities and dot1dPortCapabilitiesTable in the P-BRIDGE-MIB could be used by an attacker to determine which attacks might be useful to attempt against a given device.

The following read-only tables and objects in the Q-BRIDGE-MIB could be used by an attacker to determine which attacks might be useful to attempt against a given device, could be used by an attacker to detect whether their attacks are being blocked or filtered, or could be used to understand the logical topology of the network.

```
dot1qMaxVlanID
dot1qMaxSupportedVlans
dot1qNumVlans
dot1qFdbTable
dot1qTpFdbTable
dot1qTpGroupTable
dot1qVlanCurrentTable
dot1qPortVlanStatisticsTable
```

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

Subject: RE: VLAN ID

Bert et al -

We have concluded that the use of 4095 as a wildcard is acceptable to 802.1, and we will make any necessary changes to 802.1Q in due course to relax the current stated restriction. However, we need to know whether that is all that needs to be done to 802.1Q - i.e., is there any need to change our definitions of the managed objects in the document (Clause 12) to reflect the interpretation of 4095 as a wildcard, or is this simply an issue for the SNMP machinery to handle?

Regards,
Tony
